

Total wireless experience

3 steps into innovation in Wireless Presentation

Device-to-device

With Huddle Hub you can receive the presentation directly on the screen of the participants' personal devices. Contents become then clearly visible even when far from the main display, or even when there is no display at all. You can also present the screen to a Smart TV: where Huddle Hub is not physically connected it's possible to present to a large room display.

Multi-room

Thanks to its innovative concept, Huddle Hub One allows up to 4 simultaneous and independent wireless presentation sessions, at the same time offering the opportunity to collaborate outside the traditional meeting room. A work group can connect to one of 4 available rooms from everywhere in the company: huddle rooms, offices or even lounges.

Multi-site

With Huddle Hub, presentations can also extend to different rooms within the company, or to branch offices. Combine Huddle Hub with any UC/VC software: connect the meeting room USB webcam to the hub, and wirelessly send the AV signals to the laptop doing the videoconference. No more need for a dedicated PC in the room, just bring your laptop and keep the table free of cables.
